I have this working like a charm in windows 7 ultimate with java path to the downloaded plugin is c:/program files/java/jdk1.7.0_09/plugin/i586/i686/1.5/sun-java5-plugin-10.0.2.0_08-1-windows-i586.so. In linux I have no idea where the java path is, does anybody know where I can find it? a: Make sure you have Java installed on your system. Java is also required in order to run Eclipse. b: The "I" stands for "Install". If you've never installed Eclipse, then you can get it for free from the Java web site. I dont know what you mean with "make sure you have java installed" It should come with your system already. I tried the instruction on how to install in linux. First I looked for the java folder in the /usr/lib/jvm directory and placed the plugin there. The plugin worked fine in ubuntu 11.10. At first I just was going to test it in the new Linux mint 13. But I wanted to see if the plugin worked in java 1.7 as well. So I put the plugin in the /usr/lib/jvm/java-7-oracle/jre/lib/i386/solaris/plugin folder and did the same. I tested it in java 1.7.0_11, version 1.7.0_10 and java version "1.7.0_09". In all three cases it works. Hope this help you. Greets P.S.: And as promised a screen shot for the package manager. If you are not in the position to install the eclipse-java-mars-3.4.2.v20140115-0800-linux-x86_64.sh-package, then you should not install it yet. Re: IBM® Pagemaker® 7.0.2 serial..rar Install ibm-eclipse-java-mars-3.4.2.v20140115-0800-linux-x86_64.sh via PPA in your case. This is old news, you
